PIN DESCRIPTION	23
6.1 Power Supply Pin	23
6.4 Driver Output pins	26
DRIVER ELECTRICAL CHARACTERISTICS	28
•	
7.3 Power Consumption	30
Timing chart	31
•	
8.2 Parallel Interface Characteristics: 18, 16, 9 or 8-bit Bus (6800 Series MCU Interface 33	erface)
8.3 Serial Interface Characteristics (3-line Serial)	35
8.4 Serial Interface Characteristics (4-line Serial)	36
Function Description	37
9.1 Interface Type Selection	37
9.2 8080-series MCU Parallel Interface (P68 = '0')	38
9.2.1 Write Cycle Sequence	39
9.2.2 Read Cycle Sequence	40
9.3 6800-series MCU Parallel Interface (P68 = '1')	41
9.3.1 Write Cycle Sequence	42
9.3.2 Read Cycle Sequence	43
9.4 Serial Interface	44
9.4.1 Command Write Mode	44
9.4.2 Read Functions	46
	8.2 Parallel Interface Characteristics: 18, 16, 9 or 8-bit Bus (6800 Series MCU Interface Characteristics)

9.4.3 3-line Serial Protocol	46
9.4.4 4-line Serial Protocol	47
9.5 Data Transfer Break and Recovery	48
9.6 Data Transfer Pause	50
9.6.1 Serial Interface Pause	50
9.6.2 Parallel Interface Pause	50
9.7 Data Transfer Modes	51
9.7.1 Method 1	51
9.7.2 Method 2	51
9.8 Data Color Coding	52
9.8.1 8-bit Parallel Interface (IM2, IM1, IM0= "100")	52
9.8.2 8-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH= "03h"	52
9.8.3 8-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH= "05h"	53
9.8.4 8-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH= "06h"	54
9.8.5 16-Bit Parallel Interface (IM2,IM1, IM0= "101")	55
9.8.6 16-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH= "03h"	55
9.8.7 16-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH= "05h"	56
9.8.8 16-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH= "06h"	57
9.8.9 9-Bit Parallel Interface (IM2, IM1, IM0="110")	58
9.8.10 Write 9-bit Data for RGB 6-6-6-bit Input (262k-color)	58
9.8.11 18-Bit Parallel Interface (IM2, IM1, IM0="111")	59
9.8.12 18-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"	59
9.8.13 18-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"	60
9.8.14 18-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"	61
9.8.15 3-line Serial Interface	62
9.8.16 Write Data for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"	62
9.8.17 Write Data for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"	63
9.8.18 Write Data for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"	64
9.8.19 4-line Serial Interface	65
9.8.20 Write Data for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"	65
9.8.21 Write Data for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"	66
9.8.22 Write Data for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"	66
9.9 Display Data RAM	67
9.9.1 Configuration (GM[1:0] = "00")	67
9.9.2 Memory to Display Address Mapping	68
9.9.3 When using 128RGB x 160 resolution (GM[1:0] = "11", SMX=SMY=SRGB= '0')	68
9.9.4 When using 132RGB x 132resolution (GM[1:0] = "01", SMX=SMY=SRGB= '0')	69
9.9.5 When using 132RGB x 162 resolution (GM[1:0] = "00", SMX=SMY=SRGB= '0')	70

9.9.6 Normal Display On or Partial Mode On	71
9.9.7 When using 128RGB x 160 resolution (GM[1:0] = "11")	71
9.9.8 When using 128RGB x 160 resolution (GM[1:0] = "01")	72
9.9.9 When using 132RGB x 162 resolution (GM[1:0] = "00")	73
9.10 Address Counter	74
9.11 Memory Data Write/ Read Direction	75
9.11.1 When 128RGBx160 (GM= "11")	75
9.11.2 When 132RGBx132 (GM= "01")	75
9.11.3 When 132RGBx162 (GM= "00")	76
9.11.4 Frame Data Write Direction According to the MADCTL Parameters (MV, MX and MY).	77
9.11.5 Scroll Address Circuit	78
9.11.6 Vertical Scroll Mode	78
9.11.7 Vertical Scroll Example	79
9.11.8 Case 1: TFA + VSA + BFA<162	79
9.11.9 Case 2: TFA + VSA + BFA=162 (Rolling Scrolling)	80
9.12 Tearing Effect Output Line	81
9.12.1 Tearing Effect Line Modes	81
9.12.2 Tearing Effect Line Timings	82
9.12.3 Example 1: MPU Write is faster than panel read	83
9.12.4 Example 2: MPU Write is slower than panel read	84
9.13 Power ON/OFF Sequence	85
9.13.1 Uncontrolled Power Off	86
9.14 Power Level Definition	87
9.14.1 Power Level	87
9.14.2 Power Flow Chart	88
9.15 Reset Table	89
9.15.1 Reset Table(Default Value, GM[1:0]="11", 128RGB x 160)	89
9.15.2 Reset Table (GM[1:0]= "01", 132RGB x 132)	90
9.15.3 Reset Table (GM[1:0]= "00", 132RGB x 162)	91
9.16 Module Input/Output Pins	92
9.16.1 Output or Bi-directional (I/O) Pins	92
9.17 Reset Timing	93
9.18 Color Depth Conversion Look Up Tables	94
9.18.1 65536 Color to 262,144 Color	94
9.18.2 4096 Color to 262,144 Color	98
9.19 Sleep Out-Command and Self-Diagnostic Functions of the Display Module	100
9.19.1 Register Loading Detection	100
9.19.2 Functionality Detection	101

	9.19.3 Chip Attachment Detection (Optional)	102
	9.19.4 Display Glass Break Detection (Optional)	103
10	COMMAND	104
	10.1 System Function Command List and Description	104
	10.1.1 NOP (00h)	107
	10.1.2 SWRESET (01h): Software Reset	108
	10.1.3 RDDID (04h): Read Display ID	109
	10.1.4 RDDST (09h): Read Display Status	110
	10.1.5 RDDPM (0Ah): Read Display Power Mode	112
	10.1.6 RDDMADCTL (0Bh): Read Display MADCTL	113
	10.1.7 RDDCOLMOD (0Ch): Read Display Pixel Format	114
	10.1.8 RDDIM (0Dh): Read Display Image Mode	115
	10.1.9 RDDSM (0Eh): Read Display Signal Mode	116
	10.1.10 RDDSDR (0Fh): Read Display Self-Diagnostic Result	118
	10.1.11 SLPIN (10h): Sleep In	119
	10.1.12 SLPOUT (11h): Sleep Out	120
	10.1.13 PTLON (12h): Partial Display Mode On	121
	10.1.14 NORON (13h): Normal Display Mode On	122
	10.1.15 INVOFF (20h): Display Inversion Off	123
	10.1.16 INVON (21h): Display Inversion On	124
	10.1.17 GAMSET (26h): Gamma Set	125
	10.1.18 DISPOFF (28h): Display Off	126
	10.1.19 DISPON (29h): Display On	127
	10.1.20 CASET (2Ah): Column Address Set	128
	10.1.21 RASET (2Bh): Row Address Set	130
	10.1.22 RAMWR (2Ch): Memory Write	132
	10.1.23 RGBSET (2Dh): Color Setting for 4K, 65K and 262K	133
	10.1.24 RAMRD (2Eh): Memory Read	134
	10.1.25 PTLAR (30h): Partial Area	135
	10.1.26 SCRLAR (33h): Scroll Area Set	137
	10.1.27 TEOFF (34h): Tearing Effect Line OFF	139
	10.1.28 TEON (35h): Tearing Effect Line ON	140
	10.1.29 MADCTL (36h): Memory Data Access Control	142
	10.1.30 VSCSAD: Vertical Scroll Start Address of RAM (37h)	145
	10.1.31 IDMOFF (38h): Idle Mode Off	147
	10.1.32 IDMON (39h): Idle Mode On	148
	10.1.33 COLMOD (3Ah): Interface Pixel Format	150
	10.1.34 RDID1 (DAh): Read ID1 Value	151

	10.1.35 RDID2 (DBh): Read ID2 Value	152
	10.1.36 RDID3 (DCh): Read ID3 Value	154
	10.2 Panel Function Command List and Description	155
	10.2.1 FRMCTR1 (B1h): Frame Rate Control (In normal mode/ Full colors)	159
	10.2.2 FRMCTR2 (B2h): Frame Rate Control (In Idle mode/ 8-colors)	160
	10.2.3 FRMCTR3 (B3h): Frame Rate Control (In Partial mode/ full colors)	161
	10.2.4 INVCTR (B4h): Display Inversion Control	162
	10.2.5 PWCTR1 (C0h): Power Control 1	163
	10.2.6 PWCTR2 (C1h): Power Control 2	165
	10.2.7 PWCTR3 (C2h): Power Control 3 (in Normal mode/ Full colors)	167
	10.2.8 PWCTR4 (C3h): Power Control 4 (in Idle mode/ 8-colors)	169
	10.2.9 PWCTR5 (C4h): Power Control 5 (in Partial mode/ full-colors)	171
	10.2.10 VMCTR1 (C5h): VCOM Control 1	173
	10.2.11 VMOFCTR (C7h): VCOM Offset Control	175
	10.2.12 WRID2 (D1h): Write ID2 Value	177
	10.2.13 WRID3 (D2h): Write ID3 Value	178
	10.2.14 NVFCTR1 (D9h): NVM Control Status	179
	10.2.15 NVFCTR2 (DEh): NVM Read Command	180
	10.2.16 NVFCTR3 (DFh): NVM Write Command	181
	10.2.17 GMCTRP1 (E0h): Gamma ('+'polarity) Correction Characteristics Setting	182
	10.2.18 GMCTRN1 (E1h): Gamma '-'polarity Correction Characteristics Setting	184
	10.2.19 GCV(FCh): Gate Pump Clock Frequency Variable	186

1 GENERAL DESCRIPTION

The ST7735S is a single-chip controller/driver for 262K-color, graphic type TFT-LCD. It consists of 396 source line and 162 gate line driving circuits. This chip is capable of connecting directly to an external microprocessor, and accepts Serial Peripheral Interface (SPI), 8-bit/9-bit/16-bit/18-bit parallel interface. Display data can be stored in the on-chip display data RAM of 132 x 162 x 18 bits. It can perform display data RAM read/write operation with no external operation clock to minimize power consumption. In addition, because of the integrated power supply circuits necessary to drive liquid crystal, it is possible to make a display system with fewer components.

2 FEATURES

Single Chip TFT-LCD Controller/Driver with RAM On-chip Display Data RAM (i.e. Frame Memory)

132 (H) x RGB x 162 (V) Bits

LCD Driver Output Circuits:

Source Outputs: 132 RGB Channels

Gate Outputs: 162 Channels
Common Electrode Output

Display Colors (Color Mode)

Full Color: 262K, RGB=(666) Max., Idle Mode OFF
Color Reduce: 8-color, RGB=(111), Idle Mode ON

Programmable Pixel Color Format (Color Depth) for Various Display Data input Format

12-bit/pixel: RGB=(444) Using the 384k-bit Frame Memory and LUT 16-bit/pixel: RGB=(565) Using the 384k-bit Frame Memory and LUT 18-bit/pixel: RGB=(666) Using the 384k-bit Frame Memory and LUT

Various Interfaces

Parallel 8080-series MCU Interface

(8-bit, 9-bit, 16-bit & 18-bit)

Parallel 6800-series MCU Interface

(8-bit, 9-bit, 16-bit & 18-bit)

3-line Serial Interface

4-line Serial Interface

Display Features

Support Both Normal-black & Normal-white LC Software Programmable Color Depth Mode

Partial Window Moving & Data Scrolling

Built-in Circuits

DC/DC Converter

Adjustable VCOM Generation

Non-volatile (NV) Memory to Store Initial Register Setting

Oscillator for Display Clock Generation

Factory default value (module ID, module version, etc) are stored in NV memory.

Timing Controller

Built-in NV Memory for LCD Initial Register Setting

7-bits for ID2

8-bits for ID3

7-bits for VCOM Offset Adjustment

Wide Supply Voltage Range

I/O Voltage (VDDI to DGND): 1.65V~3.7V (VDDI ≤ VDD)

Analog Voltage (VDD to AGND): 2.5V~4.8V

On-Chip Power System

Source Voltage (GVDD to AGND): 3.15V to 5V

VCOM level (VCOM to AGND): -0.425V to -2.0V

Gate Driver HIGH Level (VGH to AGND): +10.0V to +15V

Gate Driver LOW Level (VGL to AGND): -13V to -7.5V

Operating Temperature: -30℃ to +85℃

3 PAD ARRANGEMENT

3.1 Output Bump Dimension

Item	Symbol	Size
Bump Pitch	А	16 um
Bump Width	С	16 um
Bump Height	Н	98 um
Bump Gap1 (Vertical)	J	19 um
Bump Gap2 (Horizontal)	К	16 um
Bump Area	CxH	1568 um2
Chip Boundary (Include Scribe Lane)	L	59 um

3.2 Input Bump Dimension

Boundary (Include scribe Lane)

Item	Symbol	Size
Bump Pitch 1	A1	72.5 um
Bump Pitch 2	A2	60 um
Bump Width 1	C1	38 um
Bump Width 2	C2	33 um
Bump Height	Н	88 um
Bump Gap	К	17 um
Bump Gap1	K1	22 um
Bump Gap2	K2	34.5 um
Bump Area 1	C1 X H	3344 um2
Bump Area 2	C2 X H	2904 um2
Chip Boundary(Include Scribe Lane)	L	60 um

3.3 Alignment Mark Dimension

3.4 Chip Information

Chip Size (um x um): 10080 x 670

PAD Coordinate: Pad Center Coordinate Origin: Chip Center Chip Thickness (um): 300(TYP) Bump Height (um): 12(TYP)

5 BLOCK DIAGRAM

6 PIN DESCRIPTION

6.1 Power Supply Pin

Name	1/0	Description	Connect Pin
VDD	I	Power Supply for Analog, Digital System and Booster Circuit.	VDD
VDDI	I	Power Supply for I/O system.	VDDI
AGND	I	System Ground for Analog System and Booster Circuit.	GND
DGND	I	System Ground for I/O System and Digital System.	GND

6.2 Interface Logic Pin

Name	1/0			Description	Connect pin				
		-8080/680	00 MCU	Interface Mode Select.					
P68	ı	-P68='1',	Select 6	800 MCU Parallel Interface.	DGND/VDDI				
F00	ı	-P68='0',	Select 8	080 MCU Parallel Interface.	DGND/VDDI				
		-If not use	ed, Pleas						
		MCU Para	allel Inte	rface Bus and Serial Interface select					
IM2	I	IM2='1', F	Parallel I	nterface	DGND/VDDI				
		IM2='0', S	Serial Int	erface					
		- MCU Pa	arallel Int	erface Type Selection					
		-If Not Us	ed, Plea	se Fix this Pin at VDDI or DGND Level.					
	M1,IMO I	I	I			IM1	IM0	Parallel Interface	
IM1,IM0					0	0	MCU 8-bit Parallel	DGND/VDDI	
				0	1	MCU 16-bit Parallel			
		1	0	MCU 9-bit Parallel					
		1	1	MCU 18-bit Parallel					
		- SPI4W=	·'0', 3-lin	e SPI Enable.					
SPI4W	I	- SPI4W=	:'1', 4-lin	<mark>e SPI Enable</mark> .	DGND/VDDI				
		-If Not Us	ed, Plea	se fix this Pin at DGND Level.					
		-This sign	al will re	eset the device and it must be applied to properly					
RESX	I	initialize t	initialize the chip.						
		-Signal is	active lo	ow.					
CSX	ı	-Chip Sel	ection P	 in	MCU				
COA	I	-Low Ena	ble.		IVICO				

		-Display data/command Selection Pin in MCU Interface.	
D/CX		-D/CX='1': Display Data or Parameter.	
	I	-D/CX='0': Command Data.	MCU
(SCL)	(SCL)	-In Serial Interface, this is used as SCL.	
		-If not used, please fix this pin at VDDI or DGND level.	
RDX	,	-Read Enable in 8080 MCU Parallel Interface.	MCU
KDX	ı	-If not used, please fix this pin at VDDI or DGND level.	WCO
WRX		-Write Enable in MCU Parallel Interface.	
(D/CX)	I	-In 4-line SPI, this pin is used as D/CX (data/ command selection).	MCU
(D/CX)		-If not used, please fix this pin at VDDI or DGND level.	
		-D[17:0] are used as MCU parallel interface data bus.	
D[17:0]	I/O	-D0 is the serial input/output signal in serial interface mode.	MCU
D[17.0]	1/0	-In serial interface, D[17:1] are not used and should be fixed at VDDI or	WCO
		DGND level.	
		-Tearing effect output pin to synchronies MCU to frame rate, activated	
TE	0	by S/W command.	MCU
		-If not used, please open this pin.	
		-Monitoring pin of internal oscillator clock and is turned ON/OFF by	
osc	0	S/W command.	_
		-When this pin is inactive (function OFF), this pin is DGND level.	·
		-If not used, please open this pin.	

Note1. When in parallel mode, no use data pin must be connected to "1" or "0".

Note2. When CSX="1", there is no influence to the parallel and serial interface.

6.3 Mode Selection Pin

Name	1/0		De	scription		Connect Pin									
		- During norma	l operation, pleas	e connect to VDDI											
		EXTC	Enable/disable	Modification of Exte	nd Command										
EXTC	I	0 F	VDDI/DGND												
		1 P	anel Function Co	mmands Enable.											
		-Panel Resolut	ion Selection Pins	<u> </u>											
		GM1 GM													
GM1,	1	0 0		ection of panel reso 162 (S1~S396 & G1		VDDI/DGND									
GM0	•	0 1		32 (S1~S396 & G1	. ,	VDDI/DGND									
		1 1		160 (S7~S390 & G2	· ,										
		-RGB Direction	Select H/W Pin f	or Color Filter Settir	ng.										
		SRGB		RGB Arrangement	.9.										
SRGB	I	0		3 Filter Order = 'R',	'G', 'B'	VDDI/DGND									
		1		3 Filter Order = 'B',											
		-Module Source	o Output Direction	HAW Selection Pin											
		SMX	sce Output Direction H/W Selection Pin. Scanning direction of source output												
SMX	I								1	١,	OlviX	GM= '00'	GM= '01'	GM= '11'	VDDI/DGND
SIVIA		0	S1 -> S396	S1 -> S396	S7 -> S390	VDDI/DGND									
		1	S396 -> S1	S396 -> S1	S390 -> S7										
		-Module Gate	Output Direction H	I/W Selection Pin.											
		SMY		ng direction of gate	output										
SMY	1		GM= '00'	GM= '01'	GM= '11'	VDDI/DGND									
		0	G1 -> G162	G1 -> G132	G2 -> G161	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,									
		1	G162 -> G1	G132 -> G1	G161 -> G2										
		-Liquid Crvstal	(LC) Type Select	ion Pins.											
		LCM	·	election of LC Type											
LCM	I	M	M I	0		mally White LC Typ	e	VDDI/DGND							
				1	Nor	mally Black LC Typ	e								
		-Gamma Curve	e Selection Pin.												
GS	ı	GS	Selec	ction of Gamma Cui	ve	VDDI/DGND									
	'	0		GC1=2.5, GC2=2.2,		V D D I/D O IND									
		1	GC0=2.2, G	GC1=1.8, GC2=2.5,	GC3=1.0										

VPP	I	When writing	When writing NVM, it needs external power supply voltage (7.5V).				
			put pin to select horizontal line number in TE signal. nis pin is internally pull low.				
TESEL	ı	TESEL	Selection of gamma curve	DGND			
	•	0	TE output 162 lines	50.15			
		1	TE output 160 lines				

6.4 Driver Output pins

Name	I/O	Description	Connect Pin
S1 to S396	0	- Source Driver Output Pins.	-
G1 to G162	0	- Gate Driver Output Pins.	-
AVDD	0	- Power Pin for Analog Circuits.	-
AVCL	0	- A power Supply Pin for Generating GVCL.	-
VGH	0	- Power Output Pin for Gate Driver	-
VGL	0	- Power Output (Negative) Pin for Gate Driver	-
GVDD	0	 - A power Output of Grayscale Voltage Generator. - When internal GVDD generator is not used, connect an external power supply (AVDD-0.5V) to this pin. 	-
GVCL	0	 - A power Output (Negative) of Grayscale Voltage Generator. - When internal GVCL generator is not used, connect an external power supply (AVCL+0.5V) to this pin. 	-
VCOM	0	- A Power Supply for the TFT-LCD Common Electrode.	Common Electrode
VCC	0	- Monitoring Pin of Internal Digital Reference Voltage Please Open These Pins.	
VCL	0	- A power output of VCOM voltage (Negative) generator.	
VDDIO	0	- VDDI Voltage Output Level for Monitoring.	-
DGNDO	0	- DGND Voltage Output Level for Monitoring.	-

6.5 Test Pins

Name	I/O	Description	Connect Pin
TEST2P		-These test pins for driver vender test used.	DGND
TEST1P	'	-Please connect these pins to DGND.	DGND
TESTOP[8]			
TESTOP[7]

9 Function Description

9.1 Interface Type Selection

The selection of given interfaces are done by setting IM2, IM1, and IM0 pins as shown in following table.

P68	IM2	IM1	IMO	Interface	Read Back Selection
-	0	-	-	3-line Serial Interface	Via the Read Instruction
0	1	0	0	8080 MCU 8-bit Parallel	RDX Strobe (8-bit Read Data and 8-bit Read Parameter)
0	1	0	1	8080 MCU 16-bit Parallel	RDX Strobe (16-bit Read Data and 8-bit Read Parameter)
0	1	1	0	8080 MCU 9-bit Parallel	RDX Strobe (9-bit Read Data and 8-bit Read Parameter)
0	1	1	1	8080 MCU 18-bit Parallel	RDX Strobe (18-bit Read Data and 8-bit Read Parameter)
-	0	-	-	3-line Serial Interface	Via the Read Instruction
1	1	0	0	6800 MCU 8-bit Parallel	E Strobe (8-bit Read Data and 8-bit Read Parameter)
1	1	0	1	6800 MCU 16-bit Parallel	E Strobe (16-bit Read Data and 8-bit Read Parameter)
1	1	1	0	6800 MCU 9-bit Parallel	E Strobe (9-bit Read Data and 8-bit Read Parameter)
1	1	1	1	6800 MCU 18-bit Parallel	E Strobe (18-bit Read Data and 8-bit Read Parameter)

Table 8 Interface Type Selection

Table 9 Pin Connection According to Various MCU Interface

Note: Unused pins can be open, or connected to DGND or VDDI.

9.2 8080-series MCU Parallel Interface (P68 = '0')

The MCU can use one of following interfaces: 11-lines with 8-data parallel interface, 12-lines with 9-data parallel interface, 19-line with 16-data parallel interface or 21-lines with 18-data parallel interface. The chip-select CSX (active low) enables/disables the parallel interface. RESX (active low) is an external reset signal. WRX is the parallel data write enable, RDX is the parallel data read enable and D[17:0] is parallel data bus.

The LCD driver reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits is either display data or command parameter. When D/C='0', D[17:0] bits is command. The interface functions of 8080-series parallel interface are given in following table..

IM2	IM1	IM0	Interface	D/CX	RDX	WRX	Read Back Selection			
				0	1	1	Write 8-bit Command (D7 to D0)			
1	0	0	8-bit	8-bit	1	1	1	Write 8-bit Display Data or 8-bit Parameter (D7 to D0)		
'	U	U	Parallel	1	1	1	Read 8-bit Display Data (D7 to D0)			
				1	↑	Read 8-bit Parameter or Status (D7 to D0)				
				0	1	1	Write 8-bit Command (D7 to D0)			
1	0	1	16-bit Parallel		1	1	1	Write 16-bit Display Data or 8-bit Parameter (D15 to D0)		
'	U	1			1	↑	1	Read 16-bit Display Data (D15 to D0)		
				1	1	1	Read 8-bit Parameter or Status (D7 to D0)			
				0	1	1	Write 8-bit Command (D7 to D0)			
1	4	0	9-bit	1	1	1	Write 9-bit Display Data or 8-bit Parameter (D8 to D0)			
'	ı	U	Parallel	Parallel	Parallel	1 1 Read 9-bit Display Data (D8 to D0)				
				1	↑	1	Read 8-bit Parameter or Status (D7 to D0)			
				0	1	1	Write 8-bit Command (D7 to D0)			
1	1	1	18-bit	1	1	1	Write 18-bit Display Data or 8-bit Parameter (D17 to D0)			
'	'	1	Parallel	1	↑	1	Read 18-bit Display Data (D17 to D0)			
				1	1	1	Read 8-bit Parameter or Status (D7 to D0)			

Table 10 The Function of 8080-series Parallel Interface

Note: applied for command code: DAh, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh

9.2.1 Write Cycle Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control signals (D/CX, RDX, WRX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (='0') and vice versa it is data (='1').

Figure 8 8080-series WRX Protocol

Note: WRX is an unsynchronized signal (It can be stopped).

Figure 9 8080-series Parallel Bus Protocol, Write to Register or Display RAM

9.2.2 Read Cycle Sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from LCD driver via interface. The driver sends data (D[17:0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

Figure 10 8080-series RDX Protocol

Note: RDX is an unsynchronized signal (It can be stopped).

Figure 11 8080-series Parallel Bus Protocol, Read Data from Register or Display RAM

9.3 6800-series MCU Parallel Interface (P68 = '1')

The MCU uses one of following interface: 11-lines with 8-data parallel interface, 12-lines with 9-data parallel interface, 19-lines with 16-data parallel interface, or 21-lines with 18-data parallel interface. The chip-select CSX(active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. The R/WX is the Read/Write flag and D[17:0] is parallel data bus.

The LCD driver reads the data at the falling edge of E signal when R/WX= '1' and Writes the data at the falling of the E signal when R/WX='0'. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits are display RAM data or command parameters. When D/C= '0', D[17:0] bits are commands.

The 6800-series bi-directional interface can be used for communication between the micro controller and LCD driver. The selection of this interface is done when P68 pin is high state (VDDI). Interface bus width can be selected with IM2, IM1 and IM0. The interface functions of 6800-series parallel interface are given in Table 11.

P68	IM2	IM1	IMO	Interface	D/CX	R/WX	E	Function
					0	0	→	Write 8-bit Command (D7 to D0)
1	1	0	0	8-bit Parallel	1	0	\rightarrow	Write 8-bit Display Data or 8-bit Parameter (D7 to D0)
!	'	U	U		1	1	\rightarrow	Read 8-bit Display Data (D7 to D0)
					1	1	\rightarrow	Read 8-bit Parameter or Status (D7 to D0)
					0	0	\downarrow	Write 8-bit Command (D7 to D0)
1	1	0	1	16-bit Parallel	1	0	\downarrow	Write 16-bit Display Data or 8-bit Parameter (D15 to D0)
					1	1	\downarrow	Read 16-bit Display Data (D15 to D0)
					1	1	\	Read 8-bit Parameter or Status (D7 to D0)
					0	0	\downarrow	Write 8-bit Command (D7 to D0)
1	1	1	0	9-bit Parallel	1	0	↓	Write 9-bit Display Data or 8-bit Parameter (D8 to D0)
1	1	1	U	9-DIL Farallel	1	1	↓	Read 9-bit Display Data (D8 to D0)
					1	1	\downarrow	Read 8-bit Parameter or Status (D7 to D0)
					0	0	\downarrow	Write 8-bit Command (D7 to D0)
1	1	1	1	18-bit Parallel	1	0	\downarrow	Write 18-bit Display Data or 8-bit Parameter (D17 to D0)
					1	1	↓	Read 18-bit Display Data (D17 to D0)
					1	1	\downarrow	Read 8-bit Parameter or Status (D7 to D0)

Table 11 The Function of 6800-series Parallel Interface

Note: applied for command code: DAh, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh.

9.3.1 Write Cycle Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (E low-high-low sequence) consists of 3 control signals (D/CX, E, R/WX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (='0') and vice versa it is data (='1').

Figure 12 6800-series Write Protocol

Note: E is an unsynchronized signal (It can be stopped)

Figure 13 6800-series Parallel Bus Protocol, Write to Register or Display RAM

V 1.1 Page 42 of 201 2011-11-21

9.3.2 Read Cycle Sequence

The read cycle (E low-high-low sequence) means that the host reads information from LCD driver via interface. The driver sends data (D[17:0]) to the host when there is a rising edge of E and the host reads data when there is a falling edge of E.

Figure 14 6800-series Read Protocol

Note: E is an unsynchronized signal (It can be stopped)

Figure 15 6800-series Parallel Bus Protocol, Read Data form Register or Display RAM

9.4 Serial Interface

The selection of this interface is done by IM2. See the Table 12.

IM2	4WSPI	Interface	Read Back Selection
0	0	3-line Serial Interface	Via the Read Instruction (8-bit, 24-bit and 32-bit Read Parameter)
0	1	4-line Serial Interface	Via the Read Instruction (8-bit, 24-bit and 32-bit Read Parameter)

Table 12 Selection of Serial Interface

The serial interface is either 3-lines/9-bits or 4-lines/8-bts bi-directional interface for communication between the micro controller and the LCD driver. The 3-lines serial interface use: CSX (chip enable), SCL (serial clock) and SDA (serial data input/output), and the 4-lines serial interface use: CSX (chip enable), D/CX (data/command flag), SCL (serial clock) and SDA (serial data input/output). Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

9.4.1 Command Write Mode

The write mode of the interface means the micro controller writes commands and data to the LCD driver. 3-lines serial data packet contains a control bit D/CX and a transmission byte. In 4-lines serial interface, data packet contains just transmission byte and control bit D/CX is transferred by the D/CX pin. If D/CX is "low", the transmission byte is interpreted as a command byte. If D/CX is "high", the transmission byte is stored in the display data RAM (memory write command), or command register as parameter.

Any instruction can be sent in any order to the driver. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

Figure 16 Serial Interface Data Stream Format

When CSX is "high", SCL clock is ignored. During the high period of CSX the serial interface is initialized. At the falling edge of CSX, SCL can be high or low (see Figure 17). SDA is sampled at the rising edge of SCL. D/CX indicates whether the byte is command (D/CX='0') or parameter/RAM data (D/CX='1'). D/CX is sampled when first rising edge of SCL (3-lines serial interface) or 8th rising edge of SCL (4-lines serial interface). If CSX stays low after the last bit of command/data byte, the serial interface expects the D/CX bit (3-lines serial interface) or D7 (4-lines serial interface) of the next byte at the next rising edge of SCL..

Figure 17 3-line Serial Interface Write Protocol (Write to Register with Control Bit in Transmission)

Figure 18 4-line Serial Interface Write Protocol (Write to Register with Control Bit in Transmission)

9.4.2 Read Functions

The read mode of the interface means that the micro controller reads register value from the driver. To achieve read function, the micro controller first has to send a command (read ID or register command) and then the following byte is transmitted in the opposite direction. After that CSX is required to go to high before a new command is send (see the below figure). The driver samples the SDA (input data) at rising edge of SCL, but shifts SDA (output data) at the falling edge of SCL. Thus the micro controller is supported to read at the rising edge of SCL.

After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit.

9.4.3 3-line Serial Protocol

3-line Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh Command: 8-bit Read):

3-line Serial Protocol (for RDDID Command: 24-bit Read)

3-line Serial Protocol (for RDDST Command: 32-bit Read)

Figure 19 3-line Serial Interface Read Protocol

9.4.4 4-line Serial Protocol

4-line Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh Command: 8-bit Read):

4-line Serial Protocol (for RDDID Command: 24-bit Read)

4-line Serial Protocol (for RDDST Command: 32-bit Read)

Figure 20 4-line Serial Interface Read Protocol

9.5 Data Transfer Break and Recovery

If there is a break in data transmission by RESX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been HIGH state. See the following example

Figure 21 Serial Bus Protocol, Write Mode - Interrupted by RESX

If there is a break in data transmission by CSX pulse, while transferring a command or frame memory data or multiple parameter command data, before Bit D0 of the byte has been completed, then driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following example

Figure 22 Serial Bus Protocol, Write Mode - Interrupted by CSX

If 1, 2 or more parameter commands are being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

V 1.1 Page 48 of 201 2011-11-21

Figure 23 Write Interrupts Recovery (Serial Interface)

If a 2 or more parameter commands are being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

Figure 24 Write Interrupts Recovery (Both Serial and Parallel Interface)

9.6 Data Transfer Pause

It will be possible when transferring a command, frame memory data or multiple parameter data to invoke a pause in the data transmission. If the chip select line is released after a whole byte of a frame memory data or multiple parameter data has been completed, then driver will wait and continue the frame memory data or parameter data transmission from the point where it was paused. If the chip select Line is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the chip select line is next enabled as shown below.

This applies to the following 4 conditions:

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

9.6.1 Serial Interface Pause

Figure 25 Serial Interface Pause Protocol (Pause by CSX)

9.6.2 Parallel Interface Pause

Figure 26 Parallel Bus Pause Protocol (Paused by CSX)

9.7 Data Transfer Modes

The module has three kinds color modes for transferring data to the display RAM. These are 12-bit color per pixel, 16-bit color per pixel and 18-bit color per pixel. The data format is described for each interface. Data can be downloaded to the frame memory by 2 methods.

9.7.1 Method 1

The image data is sent to the frame memory in successive frame writes, each time the frame memory is filled, the frame memory pointer is reset to the start point and the next frame is written.

9.7.2 Method 2

The image data is sent and at the end of each frame memory download, a command is sent to stop frame memory write. Then start memory write command is sent, and a new frame is downloaded.

Start frame Frame 1 Memory write Image data Any command Memory write Image data

Note 1: These apply to all data transfer Color modes on both serial and parallel interfaces.

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

9.8 Data Color Coding

9.8.1 8-bit Parallel Interface (IM2, IM1, IM0= "100")

Different display data formats are available for three Colors depth supported by listed below.

- 4k Colors, RGB 4,4,4-bit Input.
- 65k Colors, RGB 5,6,5-bit Input.
- 262k Colors, RGB 6,6,6-bit Input.

9.8.2 8-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH= "03h"

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-time transfer is used to transmit 1 pixel data with the 12-bit color depth information.

9.8.3 8-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH= "05h"

There is 1 pixel (3 sub-pixels) per 2-byte

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 2-times transfer is used to transmit 1 pixel data with the 16-bit color depth information.

9.8.4 8-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH= "06h"

There is 1 pixel (3 sub-pixels) per 3-bytes.

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

9.8.5 16-Bit Parallel Interface (IM2,IM1, IM0= "101")

Different display data formats are available for three colors depth supported by listed below.

- 4k Colors, RGB 4,4,4-bit Input
- 65k Colors, RGB 5,6,5-bit Input
- 262k Colors, RGB 6,6,6-bit Input

9.8.6 16-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH= "03h"

There is 1 pixel (3 sub-pixels) per 1 byte

Note 1: The data order is as follows, MSB=D11, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data. Note 2: 1-times transfer (D11 to D0) is used to transmit 1 pixel data with the 12-bit color depth information.

9.8.7 16-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH= "05h"

There is 1 pixel (3 sub-pixels) per 1 byte

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 1-times transfer (D15 to D0) is used to transmit 1 pixel data with the 16-bit color depth information.

9.8.8 16-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH= "06h"

There are 2 pixels (6 sub-pixels) per 3 bytes

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bits 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

9.8.9 9-Bit Parallel Interface (IM2, IM1, IM0="110")

Different display data formats are available for three colors depth supported by listed below.

-262k colors, RGB 6,6,6-bit input

9.8.10 Write 9-bit Data for RGB 6-6-6-bit Input (262k-color)

There is 1 pixel (6 sub-pixels) per 3 bytes

Note 1: The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

9.8.11 18-Bit Parallel Interface (IM2, IM1, IM0="111")

Different display data formats are available for three colors depth supported by listed below.

- 4k Colors, RGB 4,4,4-bit Input
- 65k Colors, RGB 5,6,5-bit Input
- 262k Colors, RGB 6,6,6-bit Input.

9.8.12 18-bit Data Bus for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"

There is 1 pixel (3 sub-pixels) per 1 byte

Note 1: The data order is as follows, MSB=D11, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data. Note 2: 1-times transfer is used to transmit 1 pixel data with the 12-bit color depth information.

9.8.13 18-bit Data Bus for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"

There is 1 pixel (3 sub-pixels) per 1 byte

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 1-time transfer is used to transmit 1 pixel data with the 16-bit color depth information.

9.8.14 18-bit Data Bus for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"

There is 1 pixel (3 sub-pixels) per 1 byte

Note 1: The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Read, Green and Blue data. Note 2: 1-times transfer (D17o D0) is used to transmit 1 pixel data with the 18-bit color depth information.

9.8.15 3-line Serial Interface

Different display data formats are available for three colors depth supported by the LCM listed below.

4k Colors, RGB 4-4-4-bit Input

65k Colors, RGB 5-6-5-bit Input

262k Colors, RGB 6-6-6-bit Input

9.8.16 Write Data for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"

Note 1: Pixel data with the 12-bit color depth information

Note 2: The most significant bits are: Rx3, Gx3 and Bx3

Note 3: The least significant bits are: Rx0, Gx0 and Bx0

9.8.17 Write Data for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"

Note 1: Pixel data with the 16-bit color depth information

Note 2: The most significant bits are: Rx4, Gx5 and Bx4

Note 3: The least significant bits are: Rx0, Gx0 and Bx0

9.8.18 Write Data for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"

Note 1: Pixel data with the 18-bit color depth information

Note 2: The most significant bits are: Rx5, Gx5 and Bx5

Note 3: The least significant bits are: Rx0, Gx0 and Bx0

9.8.19 4-line Serial Interface

Different display data formats are available for three colors depth supported by the LCM listed below.

4k Colors, RGB 4-4-4-bit Input

65k Colors, RGB 5-6-5-bit Input

262k Colors, RGB 6-6-6-bit Input

9.8.20 Write Data for 12-bit/Pixel (RGB 4-4-4-bit Input), 4K-Colors, 3AH="03h"

Note 1. pixel data with the 12-bit color depth information

Note 2. The most significant bits are: Rx3, Gx3 and Bx3

Note 3. The least significant bits are: Rx0, Gx0 and Bx0

9.8.21 Write Data for 16-bit/Pixel (RGB 5-6-5-bit Input), 65K-Colors, 3AH="05h"

- Note 1. pixel data with the 16-bit color depth information
- Note 2. The most significant bits are: Rx4, Gx5 and Bx4
- Note 3. The least significant bits are: Rx0, Gx0 and Bx0

9.8.22 Write Data for 18-bit/Pixel (RGB 6-6-6-bit Input), 262K-Colors, 3AH="06h"

Note 1. pixel data with the 18-bit color depth information

Note 2. The most significant bits are: Rx5, Gx5 and Bx5

Note 3. The least significant bits are: Rx0, Gx0 and Bx0

9.9 Display Data RAM

9.9.1 Configuration (GM[1:0] = "00")

The display module has an integrated 132x162x18-bit graphic type static RAM. This 384,912-bit memory allows storing on-chip a 132xRGBx162 image with an 18-bpp resolution (262K-color). There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

Figure 27 Display Data RAM Organization

9.9.6 Normal Display On or Partial Mode On

9.9.7 When using 128RGB x 160 resolution (GM[1:0] = "11")

In this mode, the content of the frame memory within an area where column pointer is 00h to 7Fh and page pointer is 00h to 9Fh is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

1). Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

2). Example for Partial Display On (PSL[7:0]=04h,PEL[7:0]=9Bh, MX=MV=ML='0', SMX=SMY='0')

9.9.8 When using 128RGB x 160 resolution (GM[1:0] = "01")

In this mode, the content of the frame memory within an area where column pointer is 00h to 83h and page pointer is 00h to 83h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

1). Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

2). Example for Partial Display On (PSL[7:0]=00h,PEL[7:0]=83h, MX=MV=ML='0',SMX=SMY='0')

9.9.9 When using 132RGB x 162 resolution (GM[1:0] = "00")

In this mode, contents of the frame memory within an area where column pointer is 00h to 83h and page pointer is 00h to A1h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0)

1). Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

2). Example for Partial Display On (PSL[7:0]=04h,PEL[7:0]=9Dh, MX=MV=ML='0', SMX=SMY='0')

9.10 Address Counter

The address counter sets the addresses of the display data RAM for writing and reading.

Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected (RGB 6-6-6-bit), according to the data formats. As soon as this pixel-data information is complete the "Write access" is activated on the RAM. The locations of RAM are addressed by the address pointers. The address ranges are X=0 to X=131 (83h) and Y=0 to Y=161 (A1h). Addresses outside these ranges are not allowed. Before writing to the RAM, a window must be defined that will be written. The window is programmable via the command registers XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0 (0h) YS=0 (0h) and XE=127 (83h), YE=161 (A1h).

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address (X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS).

For flexibility in handling a wide variety of display architectures, the commands "CASET, RASET and MADCTL" (see section 10 command list), define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Section 9.10 show the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data bust be rewritten to the display RAM.

For each image condition, the controls for the column and row counters apply as section 9.11 below

Condition	Column Counter	Row Counter
When RAMWR/RAMRD command is accepted	Return to	Return to
when RaiwwR/RaiwRD command is accepted	"Start Column (XS)"	"Start Row (YS)"
Complete Pixel Read / Write action	Increment by 1	No change
The Column country value is larger than "End Column (VE)"	Return to	In avance and had
The Column counter value is larger than "End Column (XE)"	"Start Column (XS)"	Increment by 1
The Column counter value is larger than "End Column (XE)"	Return to	Return to
and the Row counter value is larger than "End Row (YE)"	"Start Column (XS)"	"Start Row (YS)"

9.11 Memory Data Write/ Read Direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by "Memory Data Access Control" Command, bits B5 (MV), B6 (MX), B7 (MY) as described below.

Figure 28 Data Streaming order

9.11.1 When 128RGBx160 (GM= "11")

MV	MX	MY	CASET	RASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Row Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (159-Physical Row Pointer)

1	0	0	Direct to Physical Row Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (131-Physical Row Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Row Pointer	Direct to (131-Physical Column Pointer)
1	1	1	Direct to (131-Physical Row Pointer)	Direct to (131-Physical Column Pointer)

9.11.3 When 132RGBx162 (GM= "00")

MV	MX	MY	CASET	RASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Row Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (161-Physical Row Pointer)
0	1	0	Direct to (131-Physical Column Pointer)	Direct to Physical Row Pointer
0	1	1	Direct to (131-Physical Column Pointer)	Direct to (161-Physical Row Pointer)
1	0	0	Direct to Physical Row Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (161-Physical Row Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Row Pointer	Direct to (131-Physical Column Pointer)
1	1	1	Direct to (161-Physical Row Pointer)	Direct to (131-Physical Column Pointer)

Note: Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7 (MY), B6 (MX), B5 (MV). The write order for each pixel unit is

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	GO	В5	В4	В3	В2	B1	В0

One pixel unit represents 1 column and 1page counter value on the Frame Memory.

9.11.4 Frame Data Write Direction According to the MADCTL Parameters (MV, MX and MY)

Display Data	MADCTL Parameter			Image in the Host	Image in the Driver		
Direction	MV	МХ	MY	(MPU)	(DDRAM)		
Normal	0	0	0	B	H/W position (0,0) X-Y address (0,0)		
Y-Mirror	0	0	1	B	H/W position (0,0) X-Y address (0,0)		
X-Mirror	0	1	0	B	H/W position (0,0) X-Y address (0,0)		
X-Mirror Y-Mirror	0	1	1	B	H/W position (0,0) E X-Y address (0,0)		
X-Y Exchange	1	0	0	B	H/W position (0,0) X-Y address (0,0)		
X-Y Exchange Y-Mirror	1	0	1	B	H/W position (0,0) X-Y address (0,0)		
X-Y Exchange X-Mirror	1	1	0	B	H/W position (0,0) X-Y address (0,0)		

9.11.5 Scroll Address Circuit

The circuit associates lines on DDRAM with Gate output. ST7735S processes signals for the liquid crystal display on 1-line basis. Thus, when specifying a specific area in the area scroll display or partial display, you must designate it in line.

9.11.6 Vertical Scroll Mode

There is just one types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h)

When Vertical Scrolling Definition Parameters (TFA+VSA+BFA) =162. In this case, 'rolling' scrolling is applied as shown below. All the memory contents will be used.

Example 1) Panel size=132(RGB) x 162, TFA =3, VSA=157, BFA=2, SSA=6, MADCTR (ML) =0: Rolling Scroll

Example 2) Panel size=132(RGB) x 162, TFA =3, VSA=157, BFA=2, SSA=6, MADCTR (ML) =1: Rolling Scroll.

9.11.7 Vertical Scroll Example

There are 2 types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

9.11.8 Case 1: TFA + VSA + BFA<162

N/A. Do not set TFA + VSA + BFA<162. In that case, unexpected picture will be shown.

9.11.9 Case 2: TFA + VSA + BFA=162 (Rolling Scrolling)

Example 2-a) When MADCTR parameter ML="0", TFA=0, VSA=162, BFA=0 and VSCSAD=40

Example 2-b) When MADCTR parameter ML="1", TFA=10, VSA=152, BFA=0 and VSCSAD=30

9.12 Tearing Effect Output Line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

9.12.1 Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

tvdh= The LCD display is not updated from the Frame Memory

tvdl= The LCD display is updated from the Frame Memory (except Invisible Line - see above)

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 162 H-sync pulses per field.

thdh= The LCD display is not updated from the Frame Memory

thdl= The LCD display is updated from the Frame Memory (except Invisible Line - see above)

Note: During Sleep In Mode, the Tearing Output Pin is active Low.

9.12.2 Tearing Effect Line Timings

The Tearing Effect signal is described below:

Symbol	Parameter	min	max	unit	description
tvdl	Vertical Timing Low Duration	13	-	ms	
tvdh	Vertical Timing High Duration	1000	-	μs	
thdl	Horizontal Timing Low Duration	33	-	μs	
thdh	Horizontal Timing Low Duration	25	500	μs	

Table 13 AC characteristics of Tearing Effect Signal Idle Mode Off (Frame Rate = 60 Hz, Ta=25℃)

Note: The timings in Table 9.10.1 apply when MADCTL ML=0 and ML=1

The signal's rise and fall times (tf, tr) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

V 1.1 Page 82 of 201 2011-11-21

9.12.3 Example 1: MPU Write is faster than panel read

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

9.12.4 Example 2: MPU Write is slower than panel read

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer "catches" the MPU to Frame memory write position.

9.13 Power ON/OFF Sequence

VDDI and VDD can be applied in any order

VDD and VDDI can be powered down in any order

During power off, if LCD is in the Sleep Out mode, VDD and VDDI must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VDD can be powered down minimum 0msec after RESX has been released.

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

- Note 1: There will be no damage to the display module if the power sequences are not met.
- Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.
- Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.
- Note 4: If RESX line is not held stable by host during Power On Sequence as defined in the sequence below, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below

9.13.1 Uncontrolled Power Off

The uncontrolled power-off means a situation which removed a battery without the controlled power off sequence. It will neither damage the module or the host interface.

If uncontrolled power-off happened, the display will go blank and there will not any visible effect on the display (blank display) and remains blank until "Power On Sequence" powers it up.

9.14 Power Level Definition

9.14.1 Power Level

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption

Normal Mode On (full display), Idle Mode Off, Sleep Out.
 In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode

In this mode, the DC: DC converter, internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

6. Power Off Mode

In this mode, both VDD and VDDI are removed.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

9.14.2 Power Flow Chart

9.15 Reset Table

9.15.1 Reset Table(Default Value, GM[1:0]="11", 128RGB x 160)

ltem	After Power On	After H/W Reset	After S/W Reset

9.16 Module Input/Output Pins

9.16.1 Output or Bi-directional (I/O) Pins

Output or Bi-directional pins	After Power On	After Hardware Reset	After Software Reset	
TE	Low	Low	Low	
D7 to D0 (Output driver)	High-Z (Inactive)	High-Z (Inactive)	High-Z (Inactive)	

Input pins	During Power On Process	After Power On	After Hardware Reset	After Software Reset	During Power Off Process
RESX	See 9.14	Input valid	Input valid	Input valid	See 9.14
CSX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D/CX	Input invalid	Input valid	Input valid	Input valid	Input invalid
WRX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RDX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D7 to D0	Input invalid	Input valid	Input valid	Input valid	Input invalid

Note: There will be no output from D7-D0 during Power On/Off sequence, Hardware Reset and Software Reset.

9.17 Reset Timing

Related Pins	Symbol	Parameter	MIN	MAX	Unit
RESX	tRESW	Reset Pulse Duration	10	-	us
	tREST	Reset Cancel	-	5	ms
	IKESI	Reset Cancer		120	ms

Table 14 Reset Timing

Notes:

- 1. The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from NVM (or similar device) to registers. This loading is done every time when there is HW reset cancel time (tRT) within 5 ms after a rising edge of RESX.
- 2. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 9us	Reset
Between 5us and 9us	Reset Starts

- 3. During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.
- 4. Spike Rejection also applies during a valid reset pulse as shown below:

- 5. When Reset applied during Sleep In Mode.
- 6. When Reset applied during Sleep Out Mode.
- 7. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

9.19 Sleep Out-Command and Self-Diagnostic Functions of the Display Module

9.19.1 Register Loading Detection

Sleep Out-command (See section 0 "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from MTP (or similar device) to registers of the display controller is working properly.

There are compared factory values of the MTP and register values of the display controller by the display controller. If those both values (MTP and register values) are same, there is inverted (=increased by 1) a bit, which is defined in command 0 "Read Display Self-Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= increased by 1).

The flow chart for this internal function is following:

Note: There is not compared and loaded register values, which can be changed by user (00h to AFh and DAh to DDh), by the display module.

9.19.2 Functionality Detection

Sleep Out-command (See section 0 "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (only Booster voltage level). If functionality requirement is met, there is inverted (= increased by 1) a bit, which defined in command 0 "Read Display Self- Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1). The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In –mode to Sleep Out -mode, before there is possible to check if functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out –command is sent in Sleep Out -mode.

9.19.3 Chip Attachment Detection (Optional)

Sleep Out-command (See section 0 "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if a chip or chips (e.g. driver, etc.) of the display module is/are attached to the circuit route of a flex foil or display glass ITO.

There is inverted (= increased by 1) a bit, which is defined in command 0 "Read Display Self- Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D5), if the chip or chips is/are attached to the circuit route of the flex or display glass. If this chip is or those chips are not attached to the circuit route of the flex or display glass, this bit (D5) is not inverted (= increased by 1).

The following figure is for reference purposes; how this chip attachment can be implemented e.g. there are connected together 2 bumps via route of ITO or the flex foil on 4 corners of the driver (chip).

The flow chart for this internal function is following:

9.19.4 Display Glass Break Detection (Optional)

Sleep Out-command (See section 0 "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if the display glass of the display module is broken or not.

There is inverted (= increased by 1) a bit, which is defined in command 0 "Read Display Self-Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D4), if the display glass is not broken. If this display glass is broken, this bit (D4) is not inverted (= increased by 1).

The following figure is a reference, how this glass break detection can be implemented e.g. there is connected together 2 bumps via route of ITO. This route of ITO is the nearest route of the edge of the display glass.

The flow chart for this internal function is following:

10 COMMAND

[&]quot;-": Don't care

Note 1: After the H/W reset by RESX pin or S/W reset by SWRESET command, each internal register becomes default state (Refer "RESET TABLE" section)

Note 2: Undefined commands are treated as NOP (00 h) command.

Note 3: B0 to D9 and DA to F are for factory use of driver supplier.

Note 4: Commands 10h, 12h, 13h, 20h, 21h, 26h, 28h, 29h, 30h, 33h, 36h (ML parameter only), 37h, 38h and 39h are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects. During Sleep In mode, these commands are updated immediately. Read status (09h), Read Display Power Mode (0Ah), Read Display MADCTL (0Bh), Read Display Pixel Format (0Ch), Read Display Image Mode (0Dh), Read Display Signal Mode (0Eh).

10.1.1 NOP (00h)

3rd Parameter	1	1	1	-	PEL15	PEL14	PEL13	PEL12	PEL11	PEL10	PEL9	PEL8			
4th Parameter	1	1	1	-	PEL7	PEL6	PEL5	PEL4	PEL3	PEL2	PEL1	PEL0			

- -This command defines the partial mode's display area.
- -There are 4 parameters associated with this command, the first defines the Start Row (PSL) and the second the End Row (PEL), as illustrated in the figures below. PSL and PEL refer to the Frame Memory row address counter.
- -If End Row > Start Row, when MADCTL ML='0'

-If End Row > Start Row, when MADCTL ML='1'

Description

-If End Row < Start Row, when MADCTL ML='0'

-If End Row = Start Row then the Partial Area will be one row deep.

	Thio	ommon	d inct o	ofinac t	ho Vorti	inal Car	allina A	roo of t	ha dian	lov ond	not no	rformo	vortical

- -This command just defines the Vertical Scrolling Area of the display and not performs vertical scroll
- -When MADCTR B4=0
- -The 1st & 2nd parameter TFA [15:0] describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display).
- -The 3rd & 4th parameter VSA [15:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address) The first line appears immediately after the bottom most line of the Top Fixed Area.
- -The 4th & 5th parameter BFA [6:0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).

TFA, VSA and BFA refer to the Frame Memory Line Pointer

The condition is (TFA+VSA+BFA) = 162, otherwise Scrolling mode is undefined.

In Vertical Scroll Mode, MADCTR parameter MV should be set to '0'-this only affects the Frame Memory Write.

Restriction

TFA[15:0], VSA[15:0] and BFA[15:0] is based on line unit.

TFA[15:0]= 0000h, 0001h, 0002h, 0003h, ..., 00A2h

VSA[15:0]= 0000h, 0001h, 0002h, 0003h, ..., 00A2h

BFA[15:0]= 0000h, 0001h, 0002h, 0003h, ..., 00A2h

11 Power Sturcture

11.1 Driver IC Operating Voltage Specification

Fig 15 Power Booster Level

Note:

Sleep out flow: AVDD, GVDD, GVCL, VCOM switch on -> 2.4ms -> AVCL, VGH, VGL, VCL switch on -> 78.6ms

scan 2 blank frames

Sleep in flow: Scan 2 blank frames -> All analog power

11.2 Power Booster Circuit

12 Gamma Structure

12.1 Structure of Grayscale Amplifier

16 voltage levels (VIN0-VIN15) between GVDD(GVCL) and VSS are determined by the high/ mid/ low level adjustment registers. Each mid-adjustment level is split into 64 levels again by the internal ladder resistor network. As a result, grayscale amplifier generates 64 voltage levels ranging from V0 to V63 and outputs one of 64 levels.

12.2 Gamma Voltage Formula (Positive/ Negative Polarity)

Gray Level	Voltage Formula (Positive)	Voltage Formula (Negative)
0	VINP0	VINP0
1	VINP1	VINP1
2	VINP2	VINP2
3	VINP3	VINP3
4	VINP4	VINP4
5	V4-(V4-V12)*(4/32)	V4-(V4-V12)*(4/32)
6	V4-(V4-V12)*(8/32)	V4-(V4-V12)*(8/32)
7	V4-(V4-V12)*(12/32)	V4-(V4-V12)*(12/32)
8	V4-(V4-V12)*(16/32)	V4-(V4-V12)*(16/32)
9	V4-(V4-V12)*(20/32)	V4-(V4-V12)*(20/32)
10	V4-(V4-V12)*(24/32)	V4-(V4-V12)*(24/32)
11	V4-(V4-V12)*(28/32)	V4-(V4-V12)*(28/32)
12	VINP5	VINP5
13	V12-(V12-V20)*(4/32)	V12-(V12-V20)*(4/32)
14	V12-(V12-V20)*(8/32)	V12-(V12-V20)*(8/32)
15	V12-(V12-V20)*(12/32)	V12-(V12-V20)*(12/32)
16	V12-(V12-V20)*(16/32)	V12-(V12-V20)*(16/32)
17	V12-(V12-V20)*(20/32)	V12-(V12-V20)*(20/32)
18	V12-(V12-V20)*(24/32)	V12-(V12-V20)*(24/32)
19	V12-(V12-V20)*(28/32)	V12-(V12-V20)*(28/32)
20	VINP6	VINP6
21	V20-(V20-V28)*(4/32)	V20-(V20-V28)*(4/32)
22	V20-(V20-V28)*(8/32)	V20-(V20-V28)*(8/32)
23	V20-(V20-V28)*(12/32)	V20-(V20-V28)*(12/32)
24	V20-(V20-V28)*(16/32)	V20-(V20-V28)*(16/32)
25	V20-(V20-V28)*(20/32)	V20-(V20-V28)*(20/32)
26	V20-(V20-V28)*(24/32)	V20-(V20-V28)*(24/32)
27	V20-(V20-V28)*(28/32)	V20-(V20-V28)*(28/32)
28	VINP7	VINP7
29	V28-(V28-V36)* (4/32)	V28-(V28-V36)* (4/32)
30	V28-(V28-V36)* (8/32)	V28-(V28-V36)* (8/32)
31	V28-(V28-V36)* (12/32)	V28-(V28-V36)* (12/32)
32	V28-(V28-V36)* (16/32)	V28-(V28-V36)* (16/32)
33	V28-(V28-V36)* (20/32)	V28-(V28-V36)* (20/32)
34	V28-(V28-V36)* (24/32)	V28-(V28-V36)* (24/32)
35	V28-(V28-V36)* (28/32)	V28-(V28-V36)* (28/32)

36	VINP8	VINP8
37	V36-(V36-V44)*(4/32)	V36-(V36-V44)*(4/32)
38	V36-(V36-V44)*(8/32)	V36-(V36-V44)*(8/32)
39	V36-(V36-V44)*(12/32)	V36-(V36-V44)*(12/32)
40	V36-(V36-V44)*(16/32)	V36-(V36-V44)*(16/32)

13 Example Connection with Panel Direction and Different Resolution

13.1 Application of Connection with Panel Direction

Case 1: (This is default case)

- 1st Pixel is at Left Top of the panel
- RGB Filter Order = RGB

- Direction default setting (H/W) SMX = '0'
- SMY = '0'
- SRGB = '0'
- S1 = Filter R
- S2 = Filter G
- S3 = Filter B
- Display direction control (S/W)
- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

Case 2:

- 1st Pixel is at Left Top of the panel
- RGB Filter Order = BGR

- Direction default setting (H/W)
- SMX = '0'
- SMY = '0'
- **SRGB** = '1'
- S1 = Filter B
- S2 = Filter G
- S3 = Filter R
- Display direction control (S/W)
- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

Case 3:

- 1st Pixel is at Right Bottom of the panel
- RGB Filter Order = RGB

- Direction default setting (H/W)
- SMX = '1'
- SMY = '1'
- SRGB = '0'
- S1 = Filter R
- S2 = Filter G
- S3 = Filter B
- Display direction control (S/W)
- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

Case 4:

- 1st Pixel is at Right Bottom of the panel
- RGB Filter Order = BGR

- Direction default setting (H/W)
- SMX = '1'
- SMY = '1'
- SRGB = '1'
- S1 = Filter B
- S2 = Filter G
- S3 = Filter R
- Display direction control (S/W)
- X-Mirror control by MX
- Y-Mirror control by MY
- XY-Exchange control by MV

13.2 Application of Connection with Different Resolution

Case1 of Resolution (128RGB x 160) (GM[1:0] = "11")

RAM Size=128 x 160 x 18-bit (Used)

Display Size = 128RGB x 160

1). Example for SMX=SMY='0'

2). Example for SMX=SMY='1'

Case2 of Resolution (132RGB x 132) (GM[1:0] = "01")

RAM size=132 x 132 x 18-bit (Used)

Display size = 132RGB x 132

1). Example for SMX=SMY='0'

2). Example for SMX=SMY='1'

Case3 of Resolution (132RGB x 162) (GM[1:0] = "00")

RAM Size=132 x 162 x 18-bit (Used)

Display Size = 132RGB x 162

1). Example for SMX=SMY='0'

2). Example for SMX=SMY='1'

13.3 Microprocessor Interface Applications

13.3.1 8080-Series MCU Interface for 8-bit Data Bus (P68=0, IM2, IM1, IM0="100")

80 Serial MPU 8-Bit Bus

13.3.2 8080-Series MCU Interface for 16-bit Data Bus (P68=0, IM2, IM1, IM0="101")

80 Serial MPU 16-Bit Bus

13.3.3 8080-Series MCU Interface for 9-bit Data Bus (P68=0, IM2, IM1, IM0="110")

80 Serial MPU 9-Bit Bus

13.3.4 8080-Series MCU Interface for 18-bit Data Bus (P68=0, IM2, IM1, IM0="111")

80 Serial MPU 18-Bit Bus

13.3.5 6800-Series MCU Interface for 8-bit Data Bus (P68=1, IM2, IM1, IM0="100")

68 Serial MPU 8-Bit Bus

13.3.6 6800-Series MCU Interface for 16-bit Data Bus (P68=1, IM2, IM1, IM0="101")

68 Serial MPU 16-Bit Bus

13.3.7 6800-Series MCU Interface for 9-bit Data Bus (P68=1, IM2, IM1, IM0="110")

68 Serial MPU 9-Bit Bus

13.3.8 6800-Series MCU Interface for 18-bit Data Bus (P68=1, IM2, IM1, IM0="111")

68 Serial MPU 18-Bit Bus

13.3..9 3-Line Serial MCU Interface (IM2, IM1, IM0="000", SPI4W=0)

3-Pin Serial Mode

13.3.10 4-Line Serial MCU Interface (IM2, IM1, IM0="000", SPI4W=1)

4-Pin Serial Mode

14 Revision History
